1 Introduction

This Introduction provides an overview of the entire Software Requirements Specification (SRS) for the Markup generator *YODA* (*Your Outright Document Assembler*). First, we specify the purpose of this SRS, highlighting the importance of a complete and comprehensive SRS in terms of saving time and money. Thereafter we provide a brief description of the scope as well as the boundaries of *YODA*. The next two subsection represents on the one hand a table with definitions, acronyms and abbreviations needed to properly interpret the SRS and on the other hand a complete list of all documents and websites consulted during creating this SRS. The last part of this introduction gives an overview of the further content, structure and organization of the SRS.

1.1 Purpose

Good specifications are essential for a software project to be successful in regard of task execution, teamwork and costs. Since we have the mandate to build a Markup generator named *YODA*, we wrote this SRS. There are several different stakeholders with different needs involved in the development of our software project. The process of writing a SRS connects these different stakeholders like customers and engineers to establish a common understanding of what *YODA* should be able to do. With respect to implementation the SRS facilitates the division of labour by providing a reference work. All involved engineers are obliged to consult the SRS to ensure doing the right thing. The SRS may serve to justify towards our stakeholders that the defined goals are met. Explicitly quantified requirements adhering the quality goals of verifiability and traceability help to verify the correctness of the implementation and increase the probability of being achieved. This SRS gives a complete and comprehensive description of *YODA* including (non-)functional requirements and design constraints. It defines precisely what we are going to build in order to save time, costs and prevent from dissatisfied stakeholders that leads to damage of our image.

1.2 Scope

This section includes a brief description of the scope as well as the boundaries of *YODA*, both described in more detail in section 2.3 Product Functions.

YODA is a Markup-Content generator library, written in Eiffel. YODA relieves the client from the burden of generating syntactically correct Markup-Code from data all on his own.

First, a programmer imports YODA to its development environment. Then the client can facilely generate documents in Markup format by using YODA. For this purpose, the client can create an arbitrary number of YODA-Projects and adds one or several YODA-Documents to the YODA-Projects. To add elements as for instance text, lists, tables or images to the YODA-Documents, the client is advised to use YODA's own wrapper-functions to spare himself creating instances of YODA-Elements manually, even though this is a practicable approach, too. The wrapper-functions may be concatenated into each other in order to create different concatenation levels corresponding to the nested structure of Markup-languages. Code snippets already written in a Markup-language can be easily included in the document, too. However, YODA does not do any kind of correctness-check to these imported code snippets, instead the client must ensure that they are of the same Markup-language as the YODA-Project type as well as that they are syntactically correct.

In addition, YODA provides simple styling of text elements such as making part of the text bold, italic or underline. Furthermore, YODA comes with methods to print out all names of YODA-Documents contained in a YODA-Project as well as all names of YODA-Elements contained in a YODA-Documents to the console as a matter of survey. YODA offers the client for some Markup-Languages moreover the ability to add links to YODA-Documents, both external to URLs in the world wide web and internal to other YODA-Documents in the same YODA-Project. When the client has finished adding YODA-Elements to YODA-Documents and YODA-Documents to YODA-Projects, the client can render whole YODA-Projects or single YODA-Documents to one of the supported Markup-languages.

However, at time of first release YODA supports the generation of HTML documents only. But its architecture allows high extensibility with respect to output documents written in other Markup-languages as XML or Markdown.

1.3 Definitions, Acronyms and Abbreviations

To properly understand the terminology of this SRS, this table shows all titles with the matching descriptions. The reference numbers WX (Websource + and DX) correspond to the following references in the next table later on.

TABLE 2: DEFINITIONS OF ALL USED TERMS THAT DO NOT BELONG TO COMMON KNOWLEDGE

#References	Title	Description
W12	<u>Academics</u>	Highly educated person in their studies or a graduate of a university or college.
W17	<u>Adaptive Maintenance</u>	An aspect of <u>maintainability</u> , describing the facility of adapting a system prompt and easily to changes in the environment.
	<u>Administrator Rights</u>	Includes the power of decision over the incorporation of commits <ol style="list-style-type: none"> 1. the composition of the <u>YODA-Administrators</u> 2. the declaration of reported bugs as proven and list them in the according list on the <u>YODA-Bug-Board</u>.
D1	<u>Class</u>	All <u>Eiffel</u> code must exist within the context of a <u>class</u>
W18	<u>Class Diagram</u>	UML <u>class diagram</u> that shows the programmatic structure
	<u>Client</u>	Stakeholder that in some way directly interact with YODA.
	<u>Console</u>	Terminal which allows the Developer to Input data into a software and directly receive output.

	<u>Container</u>	Abstract object that contains a certain amount of specific data.
W17	<u>Corrective Maintenance</u>	An aspect of <u>maintainability</u> , describing the facility of bug detection and bug fixing, in case of a malfunction or breakdown of the system.
D3	<u>correctness</u>	<u>Correctness</u> is defined as the software's ability to perform according to its specification
W8	<u>Eiffel</u>	Object oriented programming language
W13	<u>EiffelStudio</u>	Integrated Development Environment for <u>Eiffel</u>
	<u>Encapsulation</u>	Enclose or be enclosed in or as if in a capsule
W22	<u>GitHub</u>	Web Based File Hosting-Service used for sharing Software Code
W11	<u>GNU License 2.0</u>	License out of the GNU <u>Library</u> General public license from 1991.
W1	<u>HTML</u>	Hypertext <u>Markup</u> Language used for building Websites
W19	<u>HTML-Footer</u>	Part of a HTML-Document that is located at the very bottom and is shared between multiple files. It contains legal information like Contact information, imprint or policies.
W20	<u>HTML-Head/Header</u>	Part of a HTML-Document that is located at the very top and is shared between multiple files. It contains <u>HTML-Metadata</u> , links and descriptions of the files and projects.
W21	<u>HTML-Metadata</u>	Invisible information in a HTML document that is written inside the header and addresses robots like Search-Engine crawlers.
W27	<u>Instance</u>	An <u>instance</u> of a Class is an object, following the architecture defined in the class.
W28	<u>Interface-Segregation Principle</u>	Large interfaces should be split into smaller and more specific ones so that <u>clients</u> will only have to know about the methods that are of interest to them.
W9	<u>Library</u>	A software <u>library</u> is a suite of data and programming code that is used to develop software programs and applications. It is designed to assist both the programmer and the programming language compiler in building and executing software.
W29	<u>Maintainability</u>	A design consideration concerning the ease with which YODA can be maintained once it is released and running.
W5	<u>Markdown</u>	A lightweight <u>Markup</u> language with plain text formatting syntax
W23	<u>Markup</u>	A File written in a language following certain rules and using certain keywords that specify behaviour and layouts of the text.
W23	<u>Markup-language</u>	A language that annotates text so that the computer can manipulate that text
	<u>Menu</u>	Section of the HTML-Page that links to all available Pages and Subpages in a Project.
	<u>Nesting (Layer)</u>	<u>Nesting</u> describes a recursive structure where objects contain other similar objects. The number of <u>nesting</u> layers describe how many such objects are encapsulated in each other.
UML Diagram	<u>non-terminating</u>	Continuous a Process, requires further <u>encapsulation</u> .
W10	<u>Open Source Software</u>	Software that follows certain defined criteria like having accessible source code and allowing giving away software parts through 3. Parties.
	<u>Open-Closed Principle</u>	Modules should be open and closed.
	<u>Output type</u>	The file-type that corresponds to the chosen <u>Markup-language</u> , like ".html".
	<u>Parsing</u>	Checking input on context <u>correctness</u> and possible causes of failure.
W24	<u>Perfective Maintenance</u>	An aspect of <u>maintainability</u> , describing the extendibility of a system in order to respond to changed stakeholder requirements, both in terms of

		function and efficiency.
W6	<u>Placeholder Tag</u>	Special Marker in the template that will be recognized and replaced by generated Content.
W24	<u>Preventative Maintenance</u>	An aspect of <u>maintainability</u> , describing the facility of anticipating risks as well as the understandability of a system achievable through consistent coding style and comprehensive documentation.
	<u>Print (to Console)</u>	Commanding the program to output certain information to the <u>console</u> to make it readable for the user.
W25	<u>RAM</u>	Random Access Memory, volatile data storages used in computers
D3	<u>reliability</u>	general term for <u>correctness</u> and <u>robustness</u>
	<u>Rendering</u>	Process of forming abstract data into a visible, usable result.
D3	<u>robustness</u>	Robustness is defined as its ability to react to cases not included in the specification
D3	<u>Single Responsibility Principle</u>	Every module has responsibility over a single part of the functionality provided by the software, so that it has only one reason to change.
D3	<u>Single-Choice-Principle</u>	Whenever a software system must support a set of alternatives, one and only one module in the system should know their exhaustive list.
W3	<u>Snippets</u>	An independent, self-contained piece of text in a <u>Markup</u> - or programming language
	<u>Software Project</u>	A general Project that a Programmer is working on and tries to fulfil.
W16	<u>StackOverflow</u>	Website to learn, share and improve code
W7	<u>Stakeholder</u>	All the people that in any way deal with YODA
W14	<u>Subpage</u>	Page that is listed under another Page in the <i>HTML</i> -Site Menu.
W6	<u>Template</u>	Pre-layouted file with pre-existing content and specific Placeholders.
UML Diagram	<u>terminating</u>	Finishing a Process, terminating <u>encapsulation</u> .
D3	<u>Uniform Access principle</u>	Facilities managed by a module are accessible to its <u>clients</u> in the same way whether implemented by computation or by storage.
	<u>Wrapper-function</u>	Function around a <i>YODA</i> -Object that autonomously creates and places objects without forcing the user to deal with <u>instances</u> and creations.
W26	<u>XML</u>	Extensible Markup Language used for structure and format data and information
Name	<u>YODA</u>	<u>Markup</u> generator <u>library</u>
	<u>YODA-Administrators</u>	A subset of the <u>YODA-Community</u> , including testers, managers and the support team with <u>administrator rights</u> and maintenance responsibilities.
	<u>YODA-Bug-Board</u>	A board on the <u>YODA-GitHub-Repository</u> with the objective of bug detecting and communicating. It consists of two lists, one contains supposed bugs reported by the <u>YODA-Community</u> , the other bugs proven by the <u>YODA-Administrators</u> .
	<u>YODA-Community</u>	The collectivity of all <u>YODA-Programmers</u> .
	<u>YODA-Documentation</u>	Readable Text File that ships with <i>YODA</i> and explains all the functionalities and usages of <i>YODA</i> for the identified stakeholders.
UML Diagram	<u>YODA-Element</u>	An <u>instance</u> of the Element <u>Class</u> , which is part of the <u>YODA-Library</u> .
UML Diagram	<u>YODA-Documnt</u>	An <u>instance</u> of the File <u>Class</u> , which is part of the <u>YODA-Library</u> .
	<u>YODA-Main-Functionality</u>	Guarantees the ability to generate documents in at least one <u>Markup</u> format consisting of at least the most important <u>YODA-Elements</u> as well as the fundamentals of working with <u>YODA-Projects</u> , <u>YODA-Documents</u> and <u>YODA-Elements</u> .
	<u>YODA-Methods</u>	All methods provided by <i>YODA</i> .
	<u>YODA-</u>	The Programmers working on the open source code of <i>YODA</i> . Forming in

	<u>Programmers</u>	a body the <i>YODA-Community</i> .
UML Diagram	<u>YODA-Project</u>	An <u>instance</u> of the Project <u>Class</u> , which is part of the <i>YODA-Library</i> .
	<u>YODA-Requirements-Checklist</u>	Table to facilitate keeping congruence between source code and requirements. One row for each requirement and one column for every update.

1.5 Overview

The further content, structure and organization of our SRS is abstracted in this section.

1.5.1 Section 2. Overall Description

Focuses on general factors affecting *YODA* which must be incorporated during specifying the requirements.

First, insight into already existing Markup-Content generators is delivered. Followed by a description of the product perspective. The section Product Functions gives an overview of supported and unsupported functions. In addition, it provides a differentiation between shared and specific features of the tree Markup-Languages considered. Then a short section deals with an accurately definition of the YODA-Client. The next section is about constraints for example due to Interfaces to other applications, hardware limitations, regulatory policies or environmental limitations. Finally, some assumptions which underlie the requirements are mentioned as well as some dependencies.

1.5.2 Section 3. Specific Requirements

Lists all software requirements defined for *YODA* as much consistent, complete, precise and concise as possible.

Functional requirements are listed first, partitioned into requirements related to YODA-Projects, YODA-Documents and YODA-Elements. Followed by requirements referring to the usability and reliability of *YODA*. Performance Requirements as specific response times or resource limitations are described next. Afterwards requirements enhancing the maintainability of *YODA* are specified. In the end, requirements concerning design constraints due to mandated design decisions as the used programming language are listed.

1.5.3 Section 4. Supporting Information

At the very end, an index and an appendix are provided as supporting information in order to make the SRS easier to use. The index lists all requirements by its ID, providing as further information the title as well as the page on which the requirement can be found. The appendix contains a first sketch of a class diagram, we draw to get a better idea of how *YODA* might look like. Additionally, a summarization of the naming and comment convention described in "Object-Oriented Software Construction" is provided to serve the YODA-Programmers as an overview, but does not replace the reference book "Object Oriented Software Construction".

2 Overall Description

The following chapter presents an overall description of the *YODA* including current solution, product functions, user characteristics, constraints, assumptions and dependencies. This section does not contain any specific requirements it is meant to outline the background for those requirements.

2.1 Current Solution

HTML format and other Markup-languages make data better readable and thus find many applications in software projects. We explain the current solution in the case of HTML. There are multiple ways to include HTML formats into software project. First, there's the possibility to include raw HTML in string objects, which means that the HTML gets handled as normal strings, this however leads to messy code and is very inconvenient to work with. Also, there's the way to exporting the data and then creating an HTML file using any external program or web based service. More convenient is to use a library which handles all the HTML syntax but hold on to the HTML functionality with its nesting ability and styling options. There are already some HTML generating libraries available on the internet and new ones will be written surely, however with *YODA* we want to solve the problem in our very own way.

2.2 Product Perspective

YODA is a library and thus does not include any kind of Graphical User Interface (GUI). When included into a software-project, YODA enables functionalities to wrap data from the current software-project into a well readable format such as HTML, XML or Markdown without leaving the Eiffel-editor. This allows for simultaneous data processing and data formatting within the editor and the exporting of complete Markup-Files to local repositories.

Since the interface to the library is the Eiffel Programming language, some Eiffel programming knowledge is required to use YODA.

YODA is intended to support the client in formatting data into Markup-format and will generate the Markup-code. However, the client shall provide some knowledge on nesting structures or read the YODA-Documentation carefully in order to use the whole potential of YODA.

To generate the files YODA stores the used data-files such as the template, images, snippets and more, on the local drive. Hence the memory consumption includes all these used files and additionally some Kilobytes for the finished Markup-file. The memory management is not part of YODA and is incumbent upon the client.

YODA is extensible towards other Markup-languages and new functionalities within the Markup-language.

How YODA is used is not part of this SRS but will be topic of the YODA-Documentation.

2.3 Product Functions

2.3.1 Supported Functions

YODA does provide

- creating Output for a variety of Markup-languages
- creating a YODA-Project
- creating YODA-Documents and adding them to YODA-Projects.
- creating YODA-Elements and adding them to YODA-Documents
- nesting YODA-Elements, if supported by the Markup-language
- easy to use function for creating and nesting YODA-Elements (wrapper-functions)
- individual YODA-Elements for the basic Markup-language-Elements
- preview of current content converted to the corresponding Markup-language
- rendering a project with all its files and elements to all supported Markup-languages.
- support of HTML as a Markup-language

2.3.2 Unsupported Functions

YODA does **not** provide

- any kind of version control for the client,
- code management or code storage,
- parsing,
- the editing the arguments of elements after instantiation,
- saving and exporting of elements outside of the software project,
- any kind of correctness-check on imported code snippets,

2.4 User Characteristics

YODA is designed for clients with sophisticated expertise in software development and particularly with software projects. Hence the client shall provide a basic level of programming experience in Eiffel such as using libraries, converting data types as well as handling objects and features. People with no technical understanding and no experience in the use of computers are not the category of people YODA is designed for.

2.5 Constraints

This SRS represents the state of development before taking any Design Patterns into account. Consequently, this SRS is formulated in a rather general form.

Interfaces to other applications

- YODA requires the installation of Eiffel.

High order language limitation

- YODA is entirely written in Eiffel 17.05 and can maybe not be fully used in older Eiffel Versions as well as other languages such as C++, Python or Java. YODA's output is constrained by the general output format of the supported Markup-languages.

Hardware limitation

- YODA is constrained by the fact that it relies on the client to provide the needed read and write permissions to the client's hard disk. In addition, a shortage of the client's RAM and disc space can limit YODA in its capabilities.

Reliability requirement

- The client is responsible for the content of snippets.
- The speed in which YODA does operate is highly affected by the amount of data the client wants to use.

Regulatory policies

- YODA is intended to be released as open source to the public, therefore it must fulfil the respective licensing requirement.

Parallel operation

- YODA allows threading, as long as the individual threads don't conflict with each other, namely claim access to the same variables and files, which can happen while rendering the output files.
- The client needs to make sure all the files and content YODA requires for rendering the project are in a static folder on the local disk and are not in current use of any other program.

Environmental limitation

- This document as well as YODA itself are part of a one-semester-project, hence time acts as a limiting factor.

Duration of maintenance

- The current YODA-Administrators take the liberty of limiting the guaranteed maintenance to a year after the first release of YODA. All in section 3.6 defined requirements are restricted by this constraint.

2.6 Assumptions and dependencies

YODA's workability highly depends on correct and complete installation and integration into the software project such that all of YODA's source files are stored locally and are accessible by the editor.

YODA's workability depend on the backwards compatibility of future updates of Eiffel. Consequently, it is assumed that the client's operating system supports the use of Eiffel.

It is assumed that the general structure and syntax of the supported output types does not change in a way that makes YODA's output unusable over the next 5 years. This assumption is based on the changes over the last 5 years.

All statements made in this SRS are made under the assumption that YODA's source files are not directly modified by the client.

It is assumed that the client possesses a basic knowledge of English.

3 Specific Requirements

Kommentiert [1]: Make sure all table formats are the same

3.1 Functional Requirements

Requirement ID Title	ID: x.x.x.xx, Unique identifier for each requirement within the SRS document that serves as a group indicator. Title: Individual, meaningful and descriptive name for each requirement, defines group to which the requirement belongs
Reference	Shows relation to other requirements that are relevant in this context.
Description	The definition of the requirement.
Priority Risk	Priority: Defines in which order the listed requirements should be implemented. Priority ranges from 1 to 3 with 1 being mandatory requirements for the first implementation, 2 being mandatory for the final submission and 3 being optional to implement at all. Risk: States how critical the effect of not implementing the requirement is for the System in order to work correctly and deliver the expected output. The following Risk-Levels are defined: <ul style="list-style-type: none"> • S (<i>Small Risk</i>): The validation of the requirement will only have a local effect and does not constrain the <u>YODA-Main-Functionality</u>. • M (<i>Medium Risk</i>): The violation of the requirement will cause side effect to other requirements, but will not constrain the <u>YODA-Main-Functionality</u>. • L (<i>Large Risk</i>): The violation of the requirement will constrain the <u>YODA-Main-Functionality</u> partially without an imminent risk of a breakdown of YODA. • XL (<i>Extra Large Risk</i>): The violation of the requirement will constrain the <u>YODA-Main-Functionality</u> profoundly with an imminent risk of a breakdown of YODA.

Kommentiert [MH2]: Können wir diese Graphik anders platzieren? Ist ungünstig so finde ich da es zwischen der beispiel requirement formatierung und den requirements steht

3.1.1 Project Related Requirements

ID Title	1.1.1.1 YODA-Project, Container of Files and attributes
Reference	R. 1.2.1.1, R. 1.1.6.1
Description	The <u>client</u> shall be able to create <u>YODA-Projects</u> that serve as a <u>Container</u> of related <u>YODA-Documents</u> and project attributes. Each <u>YODA-Project</u> shall have a <u>client</u> -chosen name as an attribute.
Priority Risk	1 XL

ID Title	1.1.2.1 Supported Output Types, HTML
------------	---

Reference	-
Description	The set of given <u>output types</u> shall consist only of one entry, namely <u>HTML</u> documents.
Priority Risk	1 XL

ID Title	1.1.2.2 Output extensibility, Markdown or XML
Reference	R. 1.1.2.1
Description	The software architecture shall allow easy extensibility to support more <u>output types</u> in the future, namely <u>XML</u> or <u>Markdown</u> .
Priority Risk	1 XL

ID Title	1.1.3.1 Multiple Project Instances, Project Types
Reference	-
Description	The <u>client</u> shall be able to create an arbitrary number of <u>YODA-Project instances</u> . All <u>YODA-Project instances</u> shall be completely independent from each other.
Priority Risk	1 L

ID Title	1.1.4.1 Add YODA-Documents to YODA-Projects
Reference	R. 1.2.1.1, R. 1.1.1.1
Description	For a created <u>YODA-Documents</u> , the <u>client</u> shall have the ability to add it to an arbitrary number of <u>YODA-Project instances</u> .
Priority Risk	1 XL

ID Title	1.1.4.2 Same YODA-Documents, same YODA-Project
Reference	R. 1.2.1.1, R. 1.1.1.1
Description	The <u>client</u> shall have the freedom to add the same <u>YODA-Documents</u> to an arbitrary number of <u>YODA-Project instances</u> .
Priority Risk	1 XL

ID Title	1.1.4.3 Order of YODA-Documents
Reference	R. 1.1.4.1
Description	The order of the <u>YODA-Documents</u> in the final Output shall be the same as the order in which they were added to the <u>YODA-Project</u> in the program code.
Priority Risk	1 S

ID Title	1.1.4.4 Show YODA-Documents in YODA-Project
Reference	-
Description	For each <u>YODA-Project</u> , the <u>client</u> shall be able to <u>print</u> out all names of the <u>YODA-Documents</u> contained in the <u>YODA-Project</u> to the <u>console</u> .
Priority Risk	2 S

ID Title	1.1.5.1 Render, YODA-Project, generate output
Reference	-
Description	The <u>client</u> shall have the possibility to <u>render</u> a <u>YODA-Project</u> , meaning for every <u>YODA-Documents</u> and every <u>YODA-Element</u> , to any of the supported <u>output types</u> . If the <u>YODA-Project</u> requests, all files shall be correctly linked together.
Priority Risk	3 XL

ID Title	1.1.5.2 Render YODA-Project Output String
Reference	-
Description	All necessary output data shall be returned as a well formatted string. The string should be formatted in a readable form with correct indentation.
Priority Risk	3 XL

3.1.2 File Related Requirements

ID Title	1.2.1.1 YODA-Document, Container of YODA-Elements
Reference	-
Description	The <u>client</u> shall be able to create new <u>YODA-Documents</u> , which serve as a <u>container</u> of <u>YODA-Elements</u> , Attributes and Features. Each <u>YODA-Document</u> shall have a <u>client</u> chosen name for identification purposes as an attribute.
Priority Risk	2 L

ID Title	1.2.2.1 Add YODA-Elements to YODA-Document
Reference	-
Description	The <u>client</u> shall have the freedom to add <u>YODA-Elements</u> to an arbitrary number of <u>YODA-Document</u> instances.
Priority Risk	1 XL

ID Title	1.2.2.2 Order of YODA-Elements
Reference	R. 1.2.2.1
Description	The order of the <u>YODA-Elements</u> in the final <u>Output-Document</u> shall be the same as the order in which they were added to the <u>YODA-Document</u> in the program code.
Priority Risk	1 S

ID Title	1.2.2.3 Allowed YODA-Elements in YODA-Documents
Reference	R. 1.2.2.1
Description	An <u>YODA-Element</u> can be added to a <u>YODA-Document</u> an arbitrary number of times, at arbitrary places.
Priority Risk	1 L

ID Title	1.2.3.1 Show YODA-Elements in YODA-Document
Reference	R. 1.2.2.1
Description	For each <u>YODA-Document</u> , the <u>client</u> shall be able to <u>print</u> out all names of the <u>YODA-Elements</u> contained in the <u>YODA-Document</u> to the <u>console</u> .
Priority Risk	2 S

ID Title	1.2.4.1 Rendering YODA-Documents
Reference	-
Description	Every <u>YODA-Document</u> shall offer the functionality to <u>render</u> itself, meaning to <u>render</u> all its <u>YODA-elements</u> into the <u>client</u> -chosen <u>Output-language</u> .
Priority Risk	1 XL

3.1.3 Element Related Requirements

ID Title	1.3.1.1 YODA-Element, represents Output-Snippet
Reference	-
Description	Each <u>YODA-Element</u> shall be an abstraction of a supported feature of the Output-Document languages, like Title, Table or Image.
Priority Risk	1 XL

ID Title	1.3.1.2 YODA-Element, Elements types
Reference	R. 1.3.1.1
Description	For the most important features of the output-document languages, there shall exist corresponding <u>YODA-Element-types</u> representing that feature.
Priority Risk	1 XL

ID Title	1.3.2.1 Shared YODA-Element representation
Reference	-
Description	Each <u>YODA-Element</u> shall have the representation stored of how it formally looks in the output-document language, in order to later convert the abstraction of the <u>YODA-Element</u> to concrete output.
Priority Risk	1 XL

ID Title	1.3.2.2 Not shared YODA-Element representation
Reference	R. 1.3.2.1
Description	For the most important, not shared features of the output-document languages, there shall exist a corresponding <u>YODA-Element-Interpretation</u> representing that feature for the output languages that do not directly support that Element. Such Interpretations can be combinations of supported Elements, own representations that imitate the original representation that is supported by another output language or in rare occasions that representation can be empty.
Priority Risk	1 XL

ID Title	1.3.3.1 Render YODA-Elements
Reference	-
Description	Each <u>YODA-Element</u> shall offer the functionality of <u>rendering</u> itself, meaning to convert itself into a proper text-based form to later fit the output-document.
Priority Risk	1 XL

ID Title	1.3.3.2 Rendering, external resources
Reference	-
Description	When <u>YODA-Elements</u> are <u>rendered</u> that rely on external resources like Images, the <u>client</u> shall need to store all these <u>YODA-Documents</u> into a Folder called "Resources", which lies in the previously chosen Output-Folder where the Documents get <u>rendered</u> to.
Priority Risk	1 XL

ID Title	1.3.4.1 Encapsulation of YODA-Elements
Reference	-
Description	If the supported output-languages support <u>nesting</u> of the Element, then the corresponding <u>YODA-Elements</u> shall support <u>nesting</u> too.

Priority Risk	1 XL
-----------------	--------

ID Title	1.3.5.1 Different Types of YODA-Elements
Reference	-
Description	There shall be two different types of Elements in <u>YODA</u> : The <u>terminating YODA-Elements</u> and the <u>non-terminating</u> ones. Each <u>YODA-Element</u> is either <u>terminating</u> or <u>nonterminating</u> , never both. Whether an <u>YODA-Element</u> is <u>terminating</u> or not depends on its accepted input values.
Priority Risk	1 XL

ID Title	1.3.5.2 Terminating YODA-Elements
Reference	R. 1.3.5.1
Description	A <u>terminating YODA-Element</u> shall be an <u>YODA-Element</u> that does not allow <u>encapsulation</u> in itself. A <u>terminating YODA-Element</u> can be <u>encapsulated</u> into a <u>non-terminating YODA-Element</u> , but not vice versa. A typical <u>terminating YODA-Element</u> is a text or image, in which no further <u>YODA-Elements</u> can be <u>encapsulated</u> .
Priority Risk	1 XL

ID Title	1.3.5.3 non-terminating YODA-Elements
Reference	R. 1.3.5.2
Description	<u>Non-terminating YODA-Elements</u> shall allow <u>encapsulation</u> , meaning they can receive other <u>non-terminating</u> or <u>terminating YODA-Elements</u> as its content to create several layers of <u>encapsulation</u> . A typical <u>non-terminating YODA-Element</u> would be a table, which can receive other <u>non-terminating YODA-Element</u> as cell-entries such as Lists, but also <u>terminating</u> entries like text or image.
Priority Risk	1 XL

ID Title	1.3.5.4 Encapsulation layers
Reference	R. 1.3.5.3
Description	<u>Non-terminating YODA-Elements</u> should offer <u>encapsulation</u> to an arbitrary number of levels. At the end of the <u>encapsulation-chain</u> , there always needs to be a <u>terminating YODA-Element</u> to end the <u>encapsulation</u> .
Priority Risk	1 XL

ID Title	1.3.6.1 Wrapper-Functions
Reference	-
Description	The <u>client</u> should not have to deal with manually creating instances of <u>YODA-Element</u> , like he has to when creating <u>YODA-Documents</u> and <u>YODA-Projects</u> . Instead, the <u>client</u> should have the ability to use <u>wrapper-functions</u> that create the <u>YODA-Element</u> and return its <u>instance</u> .
Priority Risk	2 M

ID Title	1.3.6.2 Concatenating Wrapper-Functions
Reference	R. 1.3.6.1
Description	For every <u>YODA-Element</u> of any type and purpose, there should also exist one or more corresponding <u>wrapper-function</u> that creates and returns the <u>YODA-Element</u> . The

	arguments that the <u>wrapper-functions</u> should take directly correspond to the arguments defined in the <u>YODA-Element</u> it creates. The <u>wrapper-functions</u> should be able to directly be <u>concatenated</u> into each other in order to create different <u>concatenation</u> levels.
Priority Risk	2 M

ID Title	1.3.7.1 Text - terminating
Reference	-
Description	The <u>client</u> should have the ability to create and add text-elements, which are just plain text <u>encapsulated</u> into an object to allow being <u>encapsulated</u> .
Priority Risk	1 L

ID Title	1.3.7.2 Text, Tags as input
Reference	R. 1.3.7.1
Description	The <u>client's</u> text input shall not have an impact on the output document's look, so <i>YODA</i> shall modify input text and exclude all words that are part of the output-document-types language.
Priority Risk	1 XL

ID Title	1.3.8.1 Image - terminating
Reference	-
Description	The <u>client</u> shall be able to add an image to his document that is either stored locally or on the web using a static URL. The <u>client</u> shall be obligated to state whether the given path points to a local or online image.
Priority Risk	1 L

ID Title	1.3.9.1 Code Snippet - terminating
Reference	-
Description	The <u>client</u> shall have the ability to insert his own code into the document, he should therefore have the ability to choose a file that contains a well-formatted <u>code-snippet</u> , which content will then be inserted into the <u>YODA-Document</u> .
Priority Risk	1 L

ID Title	1.3.9.2 Code Snippet - Conventions
Reference	R. 1.3.9.1
Description	The <u>code-snippet</u> shall be obligated to follow certain conventions to guarantee that the <u>snippet</u> won't break the output file. The conventions are named in the <u>YODA-Documentation</u> for each supported <u>output type</u> . The <u>snippet</u> shall not be <u>parsed</u> or processed to prevent errors.
Priority Risk	1 XL

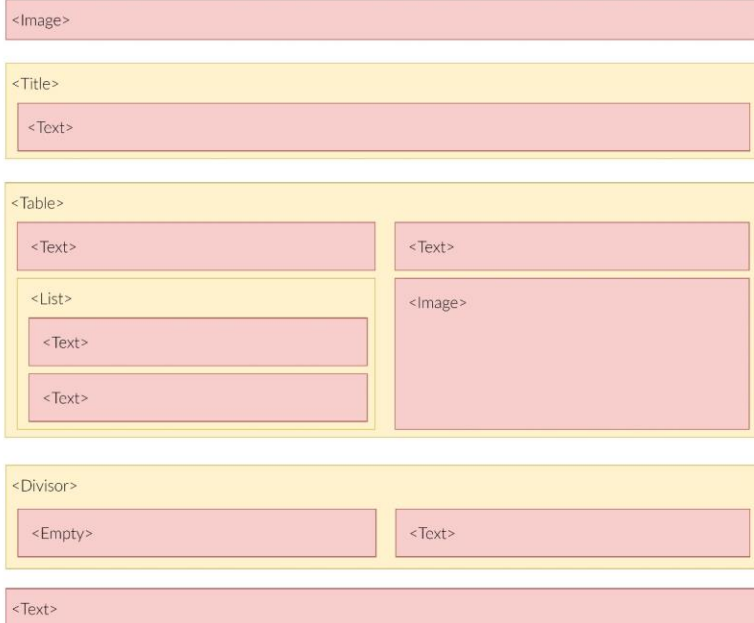

ID Title	1.3.10.1 Link – non-terminating
Reference	-
Description	The <u>client</u> shall have the ability to add links to his <u>YODA-Documents</u> . Every link can link to an external URL in the world wide web. Every <u>YODA-Element</u> inside the link will be clickable and lead to the stated URL.
Priority Risk	2 M

ID Title	1.3.11.1 Table - terminating
Reference	-
Description	The <u>client</u> shall be able to insert tables with freely choosable content into his <u>YODA-Documents</u> . The <u>client</u> provides two-dimensional data containing <u>YODA-Elements</u> , which will then be displayed in the individual cells of the table.
Priority Risk	2 L

ID Title	1.3.12.1 List – non-terminating
Reference	-
Description	The <u>client</u> shall be able to add lists to his files. Lists are either ordered or unordered, but never both at the same time.
Priority Risk	2 L

YODA-Project

YODA-File

- Non-terminating Element
- Terminating Element

FIGURE 1: USAGE OF TERMINATING AND NON-TERMINATING ELEMENTS IN YODA

The diagram above shall illustrate how concatenation in YODA shall work with use of terminating and non-terminating elements.

3.2 Usability

This section includes requirements affecting usability like training time, task times or the language used.

3.2.1 Documentation

ID Title	2.1.1.1 Documentation - learning
Reference	-
Description	The <u>YODA-Documentation</u> should provide an easy start in creating convention-following output files without previous knowledge of the output-file structure. However, basic knowledge in <u>Eiffel</u> is implied. A <u>client</u> in the role <u>academic</u> with no background in the output files convention should be able to use all of <u>YODA</u> 's functionality within 2 hours instructor-based training. <u>Client</u> in the role Administrator must be able to install the <u>library</u> and have an overview over in- and output data, which shall be provided after 1 hour of instructor-based training. <u>Clients</u> in the role designer should be able to modify existing output-type documents in order to automatically generate and place content in them within 0.5 hour of instructor-based training. A <u>client</u> in the role developer shall be able to extend <u>YODA</u> to other output-languages that are similar to XML in case of modularity of elements. Instructor-based training time for achieving this will take 8 hours.
Priority Risk	1 -

3.2.2 Training

ID Title	2.2.1.1 Client Training
Reference	-
Description	The following <u>client</u> -types must be able to use the system productively for their respective everyday work-life: <ul style="list-style-type: none"> • <u>Client</u>, experience in <u>Eiffel</u> & <u>HTML</u> or <u>Markup</u> - after 0.5 days of training • <u>Client</u>, experienced in <u>Eiffel</u>, no experience in <u>HTML</u> or <u>Markup</u> - after 1 day of training • <u>Client</u>, no experience in <u>Eiffel</u> & <u>HTML</u> or <u>Markup</u> - after 3 days of training
Priority Risk	1 -

3.2.3 Task Times

ID Title	2.3.1.1 Task Times
Reference	-
Description	<ul style="list-style-type: none"> • For a trained <u>client</u>, creating a <u>YODA-Project</u> with one <u>YODA-Document</u> containing no <u>nested YODA-Elements</u> and at most 3 <u>not-nested YODA-Elements</u> with no styling at all, shall take no longer than 30 minutes.

	<ul style="list-style-type: none"> For a trained <u>client</u>, creating a single <u>YODA-Project</u> with not more than 3 not interlinked <u>YODA-Documents</u> each not containing more than 3 <u>YODA-Elements</u> with one <u>nesting layer</u> at most and no styling included, shall take no more than 2 hours. In general task times can differ in great extent depending on the complexity of the <u>YODA-Project</u> e.g. <u>nesting layers</u>, styling and interlinking of the <u>YODA-Documents</u> as <u>Subpages</u>.
Priority Risk	1 -

3.2.4 Language

ID Title	2.4.1.1 Language
Reference	-
Description	The used language is English.
Priority Risk	1 -

3.3 Reliability

The Eiffel mechanisms such as static typing, assertions, automatic memory management and disciplined exception handling, enabling the YODA-Programmers to state correctness and robustness requirements, and enabling tools to detect inconsistencies before they lead to defects are the key factors that allow reliability.

3.3.1 Availability

ID Title	3.1.1.1 Availability
Reference	-
Description	<u>YODA</u> is used as a <u>library</u> without needing an internet connection in order to use it although it is recommended. The system shall be available for use at 24 hours a day, every day of the week. Since <u>YODA</u> shall be open source it shall be possible to add useful and correct functionality via <u>GitHub</u> . <u>Clients</u> can pull from this repository in order to add more functions.
Priority Risk	1 -

3.3.2 Error rate

ID Title	3.2.1.1 Error rate
Reference	-
Description	<p>The quality of the input by the <u>client</u> is out of scope for this document.</p> <p>The first published version of the <u>library</u> shall have sufficient quality. This is defined by:</p> <ol style="list-style-type: none"> Not more than 2 errors per week Not more than 2 patch severity errors per two weeks Not more than 3 medium and low severity errors are per three weeks
Priority Risk	2 -

3.3.3 Error handling

ID Title	3.3.1.1 Error handling
Reference	3.2.1.1
Description	Error rate shall be as low as possible through using design by contract in <u>Eiffel</u> .

Kommentiert [3]: Hier wurden die Requirements mit Schriftgröße 10 geschrieben in den Tabellen, oben aber überall mit 11. Consistent? :O

Kommentiert [4]: das tabellenformat ist eh anders. erst spalte ist auch schmaler. wir müssen alles einheitlich machen. UND wir müssen endlich klären wo wir Tabellen nutzen und wo nicht! Meine Stimme ist für überall Tabellen auch wenn es zum teil so scheint als würde es keinen sinn machen. er erleichtert die referenzierung auch wenn die Tabellen zur zeit nirgens als Referenz aufgeführt sind, wenn sie eine ID habe kann man später, falls nötig besser referenzieren.

Kommentiert [5]: Finde ich gut!

	In case of errors there shall be detailed error messages. Certain errors shall be handled automatically.
Priority Risk	2 -

Kommentiert [6]: The use of "certain" implies that we don't know which errors we want to handle automatically. this goes somewhat against the rules of the 15 goals. we change it to "most common" but then we have to specify further, like "the 3 most common errors during the development and testing shall be handled automatically" (is that reasonable/ feasible?)

Kommentiert [7]: Es reicht, wenn wir es abstrahieren und einfach certain schreiben... Es stimmt ja schon, dass wir die Probleme und die errors und so einfach gar noch nicht kennen

Kommentiert [8]: hmm stimmt eigentlich!

3.3.4 Security

ID Title	3.4.1.1 Security
Reference	-
Description	YODA will not collect nor store any data of any <u>clients</u> .
Priority Risk	1 -

3.4 Performance Requirements

The golden mean between performance and efficiency like *Dr. Abstract* and *Mr. Microsecond* is hard to meet. But in order to be expandable the focus shall be on the side of architecture and abstraction to easily add other features and functionality.

Kommentiert [9]: am I right that this explains that we rather focus on an expandable architecture then being efficient?

Kommentiert [10]: Genau

3.4.1 Response Time

ID Title	4.1.1.1 Response Time
Reference	-
Description	Pure YODA code shall take an average of 10 seconds to compile and about 1 second to execute. The maximum shall lie between 20 to 30 seconds to compile and 5 seconds to execute.
Priority Risk	1 -

3.5 Maintainability

Maintainability is a design consideration concerning the ease with which YODA can be maintained once it is released and running. One aspect of Maintainability describes the facility of bug detection and bug fixing, in case of a malfunction or breakdown of YODA, referred to as corrective Maintenance. Another aspect is the capability of adapting YODA prompt and easily to changes in the environment such as a release of a new Eiffel version, known as adaptive maintenance. Moreover, maintainability involves the handling of perfective maintenance. The main focus lies on a highly extendable software architecture in order to respond to changed stakeholder requirements, both in terms of function and efficiency. A fourth aspect of maintainability deals with the preventative maintenance. This includes infrastructure to anticipate risks as well as the criterion of understandability achievable through consistent coding style and comprehensive documentation.

3.5.1 Corrective Maintenance

ID Title	5.1.1.1 Bug classification
Reference	-
Description	The <u>YODA-Administrators</u> classify bugs <ul style="list-style-type: none"> - that are local, without constraining the <u>YODA-Main-Functionality</u> into S (<i>Small Risk</i>) - that cause side-effects, without constraining the <u>YODA-Main-Functionality</u> into M (<i>Medium Risk</i>) - constraining the <u>YODA-Main-Functionality</u> partially without an imminent risk of a breakdown of YODA into L (<i>Large Risk</i>)

	- constraining the <u>YODA-Main-Functionality</u> profoundly with an imminent risk of a breakdown of YODA. into XL (<i>Extra Large Risk</i>)
Priority Risk	1 XL

ID Title	5.1.1.2 Bug detection, Test coverage, Test disposability
Reference	R. 5.4.1.1
Description	The <u>YODA-Administrators</u> should <ol style="list-style-type: none"> 1. check the <u>YODA-Bug-Board</u> on bugs reported by the <u>YODA-Community</u> once a week. 2. undertake the annual scheduled checks The <u>YODA-Community</u> should <ol style="list-style-type: none"> 1. write tests that covers 70% of the code. 2. should put the whole testing environment at the disposal of the community once the <u>library</u> is declared as open source.
Priority Risk	2 XL

ID Title	5.1.1.3 Bug fixing
Reference	R. 5.1.1.1
Description	The <u>YODA-Administrators</u> should fix bugs <ol style="list-style-type: none"> 1. of type XL within 1 2. of type L within 3 3. of type M within 7 4. of type S within 21 day(s) after reported on <u>GitHub</u> by the <u>YODA-Community</u> .
Priority Risk	1 XL

ID Title	5.1.1.4 Bug communicating
Reference	-
Description	The <u>YODA-Administrators</u> should set a <u>YODA-Bug-Board</u> up on their <u>GitHub</u> site. The <u>YODA-Bug-Board</u> consists of two lists, one contains supposed bugs reported by the <u>YODA-Community</u> , the other bugs proven by the <u>YODA-Administrators</u> . <ol style="list-style-type: none"> 1. The entries of the first list should consist of a bug index, a bug title, a short bug description referring to the observed limitations, the bug detection date. 2. The entries of the second list should consist of a bug index, a bug title, a short bug description referring to the caused limitations, the bug detection date, the bug classification and a bug fix duration prediction. After the fixing a bug fixing report should be added to the entry, which describes the conducted changes and the affected <u>YODA-Methods</u>.
Priority Risk	1 XL

3.5.2 Adaptive Maintenance

ID Title	5.2.1.1 Compatibility with Eiffel
Reference	-

Description	The <u>YODA-Community</u> should adapt the source code of the <u>library</u> , while keeping the same functionality, to new <u>Eiffel</u> versions that are not compatible with the current one within 1 month after the <u>Eiffel</u> versions release.
Priority Risk	1 XL

3.5.3 Perfective Maintenance

ID Title	5.3.1.1 Commit incorporation
Reference	-
Description	<p>The <u>YODA-Administrators</u> should decide over the incorporation of committed code into the <u>library</u> within at most 21 days after commitment.</p> <p>An incorporation requires</p> <ol style="list-style-type: none"> 1. the new code being conform with the reviewed SRS 2. writing tests covering the new code 3. the new code passing all written tests <p>An incorporation goes along with</p> <ol style="list-style-type: none"> 1. incorporating the committed code into the source code 2. updating the <u>YODA-Requirements-Checklist</u>, the <u>YODA-Documentation</u> 3. making the correspondent tests accessible to the community by uploading them to <u>GitHub</u>.
Priority Risk	3 S

ID Title	5.3.2.1 YODA-Requirements-Checklist
Reference	-
Description	<p><u>YODA-Administrators</u> should write a <u>YODA-Requirements-Checklist</u> to facilitate keeping congruence between source code and requirements, and hold it up to date. One row for each requirement and one column for every update. The column header should consist of two lines, one for the update date and one for a brief summary of the changes done regarding the update.</p> <p>After every change in requirements the checklist must be updated by</p> <ol style="list-style-type: none"> 1. recording the change in requirements <ol style="list-style-type: none"> a. add rows for new or changed requirements b. mark rows with out-of-date requirements 2. generating a new column with the date of the change 3. recording for each requirement if it is implemented in the current version <p>After every change in code the checklist must be updated by</p> <ol style="list-style-type: none"> 1. recording the change in code 2. generating a new column with the date of the change 3. recording for each requirement if it is implemented in the current version.
Priority Risk	3 S

ID Title	5.3.2.2 YODA-Requirements-Checklist conformity
Reference	R. 5.3.2.1

Description	The <u>YODA-Administrators</u> mustn't release code before it is at 100% conform to the <u>YODA-Requirements-Checklist</u> at state of release.
Priority Risk	2 L

ID Title	5.3.3.1 YODA-Design-Document
Reference	-
Description	The <u>YODA-Programmer</u> shall note down design decision and used design pattern in a design document as for documentation reason and for better understanding of the program structure
Priority Risk	2 M

ID Title	5.3.4.1 Software architecture, Continuity
Reference	-
Description	The <u>YODA-Programmer</u> should apply extendibility to YODAs underlying architecture ensuring that small changes in the SRS induce only small changes in architecture. For this purpose, the <u>Principle of Uniform Access</u> should be taken into consideration.
Priority Risk	2 M

ID Title	5.3.4.2 Software architecture, Single Choice Principle
Reference	-
Description	The <u>YODA-Programmer</u> should apply the <u>Single-Choice-Principle</u> in respect of <u>YODA-Projects</u> , <u>YODA-Documents</u> and <u>YODA-Elements</u> .
Priority Risk	2 M

ID Title	5.3.4.3 Software architecture, Open-Closed Principle
Reference	-
Description	The <u>YODA-Programmers</u> should structure the <u>library</u> in such a way that it is extensible for other <u>Markup-language</u> output formats, as well as additional functionality within an already existing <u>Markup-language</u> , by adding new <u>classes</u> , attributes and methods to the source code with heavy usage of already existing components, instead of changing or copy-pasting current code.
Priority Risk	2 M

ID Title	5.3.4.4 Software architecture, Single Responsibility Principle
Reference	-
Description	The <u>YODA-Programmers</u> should create every module in such a way, that it has responsibility over a single part of the functionality provided by the software, so that it has only one reason to change.
Priority Risk	2 M

ID Title	5.3.4.5 Software architecture, Interface-Segregation Principle
Reference	-
Description	The <u>YODA-Programmers</u> should split interfaces that are very large into smaller and more specific ones so that <u>clients</u> will only have to know about the methods that are of interest to them.
Priority Risk	2 S

3.5.4 Preventive Maintenance

ID Title	5.4.1.1 Scheduled checks
------------	-----------------------------------

Reference	-
Description	<p>The <u>YODA-Administrators</u> check YODA once a year by</p> <ol style="list-style-type: none"> 1. running the entire test set over the source code in order to detect latent faults 2. studying the <u>Class Diagram</u> regarding to the architectural requirements defined in the SRS in order to detect out-of-date due to extensions and induce adaption 3. analysing the effects of the newest <u>Eiffel</u> version on YODA.
Priority Risk	2 S

ID Title	5.4.2.1 Consistent Coding Style
Reference	D3
Description	<p>All <u>YODA-Programmers</u> in the team should apply the same coding style with respect to</p> <ol style="list-style-type: none"> 1. Layout 2. Names 3. Comments <p>generating a consistent source code.</p> <p>The coding style should abide the <u>Eiffel</u> conventions described in "<i>Object-Oriented Software Construction</i>", see sections 4.2.1 and 4.2.2.</p>
Priority Risk	2 S

ID Title	5.4.2.2 Consistent Layout
Reference	D3
Description	<p>All <u>YODA-Programmers</u> should apply the same layout with respect to</p> <ol style="list-style-type: none"> 1. Height and width 2. Indenting details 3. Spaces 4. Precedence and parentheses 5. Semicolons 6. Assertions <p>generating a consistent source code.</p>
Priority Risk	1 S

ID Title	5.4.3.1 Support
Reference	-
Description	<p>The <u>YODA-Administrators</u> should provide</p> <ol style="list-style-type: none"> 1. an open source code with comments conform to the SRS on <u>GitHub</u> 2. a <u>YODA-Documentation</u> on <u>GitHub</u> 3. answers within a month to unanswered questions on <u>StackOverflow</u> regarding the use of the <u>library</u> 4. an e-mail address for direct contact, with a response rate of at least 60% within 3 days for topics regarding bugs, extensions and unanswered problems that were posted on <u>StackOverflow</u> before.
Priority Risk	2 M

3.6 Design Constraints

Design constraints describe decisions made before building the system which have to be addressed during the building phase.

ID Title	6.0.1.1 Non-interfering
Reference	-
Description	YODA shall not interfere negatively with any other system- or operation.
Priority Risk	1 XL

3.6.1 Software language and Coding

ID Title	6.1.1.1 Eiffel - Coding
Reference	-
Description	All coding shall be done in <u>Eiffel</u> . At every point in time, all code shall be on the same version of <u>Eiffel</u> . The base Version used for this project is <u>Eiffel</u> 17.05, which is also the version the system shall be tested with.
Priority Risk	1

ID Title	6.1.1.2 External Libraries
Reference	-
Description	YODA shall run on the <u>client's</u> system without installing or buying any additional <u>libraries</u> except the ones that standardly ship with <u>Eiffel</u> 17.05.
Priority Risk	1 -

ID Title	6.1.1.3 Operating Systems used for Development
Reference	-
Description	The development and all testing of YODA will happen on Windows and Mac OS.
Priority Risk	1 XL

3.6.2 Development tools

ID Title	6.2.1.1 EiffelStudio
Reference	-
Description	For the development of YODA, the tool to be used shall be <u>EiffelStudio</u> 17.05.
Priority Risk	1 S

ID Title	6.2.1.2 Version Control - GitHub
Reference	-
Description	YODA's versions shall be managed by one <u>GitHub</u> repository.
Priority Risk	1 S

Kommentiert [11]: Added GitHub to development tools

3.6.3 Architectural and Design Constraints

ID Title	6.3.1.1 Open Source
Reference	-
Description	YODA shall be released under an open source free software licence <u>GNU Library General Public License</u> , version 2 (SPDX short identifier: LGPL-2.0)
Priority Risk	2 S

ID Title	6.3.2.1 Placeholder-Tags Convention
Reference	-
Description	All <u>Templates</u> shall use the same <u>placeholder-tags</u> . The set of <u>placeholder-tag</u> shall be minimal but complete, which means it shall contain one and only one tag for every different Element supported per <u>Markup-language</u> . All <u>placeholder-tags</u> shall be listed in the <u>YODA-Dokumentation</u>
Priority Risk	1 XL

Kommentiert [12]: Joel da placeholder-tag convention jetzt bisch du wieder drah :P

Kommentiert [13]: lol

ID Title	6.3.3.1 Library Constraints
Reference	-
Description	<u>YODA</u> is a <u>library</u> , thus <u>YODA</u> shall NOT provide the functionality to edit and change <u>YODA-Elements</u> after instantiation since the <u>YODA-Element</u> do not exist until <u>rendering</u> . It's the <u>client's</u> task to instantiate the <u>YODA-Element</u> in the form in which it should finally look when <u>rendering</u> .
Priority Risk	1 XL

3.7 External Interfaces

EiffelStudio acts as the main interface to access all the functionalities of YODA such as creating new YODA-Project or adding content to them.

3.7.1 User Interfaces

The main client interface shall be EiffelStudio. All the functionalities of YODA can be accessed through EiffelStudio. Additional interfaces include templates on which the generated code can be displayed. Changes and additions to the displayed content shall be made in EiffelStudio.

3.7.2 Software Interfaces

Software interfaces include the templates provided by the YODA-Programmers but also the GitHub Repository of YODA.

Another interface is the client provided folder named "resources" (R 1.3.3.2) through which YODA shall have access to the files used in the YODA-Project such as images or snippets.

3.7.3 Communications Interfaces

YODA does not contain any communication Interfaces. All communication from client to developer shall happen over GitHub and is not integrated into YODA itself. The client shall be provided with information about YODA via GitHub and the YODA-Dokumentation on there. This information exchange is also not integrated into YODA itself (R 3.6.1.1).

4 Supporting Information

4.1 Requirement index

Project Related Requirements	Page
1.1.1.1 YODA-Project, Container of Files and attributes	9
1.1.2.1 Supported Output Types, HTML	9
1.1.2.2 Output extensibility, Markdown or XML	10
1.1.3.1 Multiple Project Instances, Project Types	10
1.1.4.1 Add YODA-Documents to YODA-Projects	10
1.1.4.2 Same YODA-Document, same YODA-Project	10
1.1.4.3 Order of YODA-Documents	10
1.1.4.4 Show YODA-Documents in YODA-Project	10
1.1.5.1 Render, YODA-Project, generate output	10
1.1.5.2 Render YODA-Project Output String	11
File Related Requirements	
1.2.1.1 YODA-Document, Container of YODA-Elements	11
1.2.2.1 Add YODA-Elements to YODA-Document	11
1.2.2.2 Order of YODA-Elements	11
1.2.2.3 Allowed YODA-Elements in YODA-Documents	11
1.2.3.1 Show YODA-Elements in YODA-Document	11
1.2.4.1 Rendering YODA-Documents	11
Element Related Requirements	
1.3.1.1 YODA-Element, represents Output-Snippet	12
1.3.1.2 YODA-Element, Elements types	12
1.3.2.1 Shared YODA-Element representation	12
1.3.2.2 Not shared YODA-Element representation	12
1.3.3.1 Render YODA-Elements	12
1.3.3.2 Rendering, external resources	12
1.3.4.1 Encapsulation of YODA-Elements	12
1.3.5.1 Different Types of YODA-Elements	13
1.3.5.2 Terminating YODA-Elements	13
1.3.5.3 non-terminating YODA-Elements	13
1.3.5.4 Encapsulation layers	13
1.3.6.1 Wrapper-Functions	13
1.3.6.2 Concatenating Wrapper-Functions	13
1.3.7.1 Text - terminating	14
1.3.7.2 Text, Tags as input	14
1.3.8.1 Image - terminating	14
1.3.9.1 Code Snippet - terminating	14
1.3.9.2 Code Snippet - Conventions	14
1.3.10.1 Link – non-terminating	14
1.3.11.1 Table - terminating	15
1.3.12.1 List – non-terminating	15
Usability	
2.1.1.1 Documentation – learning	16
2.2.1.1 Client Training	16
2.3.1.1 Task Times	16
2.4.1.1 Language	17
Reliability	
3.1.1.1 Availability	17

3.2.1.1 Error rate	17
3.3.1.1 Error handling	17
3.4.1.1 Security	18
Performance Requirements	
4.1.1.1 Response Time	18
Maintainability	
5.1.1.1 Bug classification	18
5.1.1.2 Bug detection, Test coverage, Test disposability	19
5.1.1.3 Bug fixing	19
5.1.1.4 Bug communicating	19
5.2.1.1 Compatibility with Eiffel	19
5.3.1.1 Commit incorporation	20
5.3.2.1 YODA-Requirements-Checklist	20
5.3.2.2 YODA-Requirements-Checklist conformity	20
5.3.3.1 YODA-Design-Document	21
5.3.4.1 Software architecture, Continuity	21
5.3.4.2 Software architecture, Single Choice Principle	21
5.3.4.3 Software architecture, Open-Closed Principle	21
5.3.4.4 Software architecture, Single Responsibility Principle	21
5.3.4.5 Software architecture, Interface-Segregation Principle	21
5.4.1.1 Scheduled checks	21
5.4.2.1 Consistent Coding Style	22
5.4.2.2 Consistent Layout	22
5.4.3.1 Support	22
Design Constraints	
6.0.1.1 Non-interfering	23
6.1.1.1 Eiffel - Coding	23
6.1.1.2 External Libraries	23
6.1.1.3 Operating Systems used for Development	23
6.2.1.1 EiffelStudio	23
6.2.1.2 Version Control - GitHub	23
6.3.1.1 Open Source	23
6.3.2.1 Placeholder-Tags Convention	24
6.3.3.1 Library Constraints	24

4.2 Appendix

4.2.1 Naming Convention

This naming convention summarizes the *Eiffel* naming convention described in “Object Oriented Software Construction”. It should serve the YODA-Programmers as an overview, but does not replace the mentioned reference book.

Letter case of Names	<p>The programmers should write</p> <ol style="list-style-type: none">1. <i>class</i> names and formal generic parameters in all uppercase characters2. feature names, non-constant attributes, routines other than once functions, local entities and routine arguments in all lower-case characters3. constant attributes and once functions with the first letter in uppercase and the rest in lowercase to make <i>class</i> texts consistent and readable.
Compound words	<p>The programmers should write compound names by separating words by the underscore (" _ ") character to enhance readability.</p>
Name	<p>The programmers should choose names that are</p> <ol style="list-style-type: none">1. meaningful - to enhance clarity by indicating the intent use of the bearer of the name2. terse - to avoid exaggerated complexity by eliminating unneeded redundancies, including the applying of the composite feature name rule,3. explicit - to enhance clarity by using full words, not abbreviations.
Grammatical categories	<p>The programmers should</p> <ol style="list-style-type: none">1. use nouns for <i>class</i> names, may use adjectives for <i>deferred classes</i> describing a structural property2. apply the Command-Query separation principle for routine names3. use verbs in the infinitive or imperative, possibly with complements for procedures4. use nouns for non-boolean query names and adjectives (maybe in <i>is_</i> form) for boolean queries, never use imperative or infinitive verbs for attributes and functions

4.2.2 Comment Convention

This comment convention summarizes the *Eiffel* comment convention described in “Object Oriented Software Construction”. It should serve the YODA-Programmers as an overview, but does not replace the mentioned reference book.

Header comments	<p>The programmers should write in the source code for every routine a header comment with a one step further indentation than the start of the routine body.</p> <p>The header comment should be</p> <ol style="list-style-type: none">1. informative by naming what a query returns, qualified noun for a non-boolean query, question form for a boolean query and imperatives or infinitives for a command2. terse by saying what the routine does, not that it does it, applying the Command-Query Separation principle, not paraphrasing type information or precondition's requirements
Feature clause header comments	<p>The programmers should write in the source code for every feature a feature clause header comment on the same line as the keyword feature, characterizing the category the feature belongs to.</p>
Indexing clauses	<p>The programmers should write indexing clauses at the beginning of each <i>class</i>.</p>
Non-header comments	<p>The programmers should write non-header comments in the source code only if they provide additional information to the pre- and postconditions, the Invariants and the other forms of comments, needed to prevent confusion and errors.</p> <p>Non-header comments should be of a level of abstraction higher than the code it documents, summarizing its effect instead of paraphrase it.</p>
Software entities	<p>The programmers should write software entities like attributes or arguments in the source code between an opening and a closing quote.</p>
